

Daylight Privacy Film (One Way Mirror) Internal 1.52x10mtrs (Model: Q0094)

- To see without being seen. The principle of a measured metallization of polyester support forms a reflective screen in the daylight which reflects an image as a mirror, while preserving transparency. A user can see without being seen. The application of a one-way mirror film makes it possible to efficiently solve the delicate problem of prying eyes posed by large glazed surfaces.

- Solutions provided by curtains and blinds are not always suitable for professional premises and causes a significant loss of light. A one-way mirror film provides protection to all types of glass surfaces, conserves natural light and restricts a view from outside to inside in offices on a ground floor, meeting rooms, etc.
